Tris(bis(phenylmethyl)carbamo-dithioato-S, S), commonly referred to as tris(N, N-dibenzylidithiocarbamato) indium(III), $\text{In}(\text{S}_2\text{CNBz}_2)_3$, was synthesized and characterized by single crystal X-ray crystallography. The compound crystallizes in the triclinic space group P1 bar with two molecules per unit cell. The material was further characterized using a novel analytical system employing the combined powers of thermogravimetric analysis, gas chromatography-mass spectrometry and Fourier-Transform infrared spectroscopy to investigate its potential use as a precursor for the chemical vapor deposition (CVD) of thin film materials for photovoltaic applications. Upon heating, the material thermally decomposes to release CS_2 and benzyl moieties into the gas phase, resulting in bulk In_2S_3 . Preliminary spray CVD experiments indicate that $\text{In}(\text{S}_2\text{CNBz}_2)_3$ decomposed on a Cu substrate reacts to produce stoichiometric CuInS_2 films. This item ships from La Vergne, TN.
